IRONVAULT - CEO GUIDE

Operate the platform safely

A practical guide to the private CEO Control Center for gym accounts, invitations, owner subscriptions, member migration, backups, and audit history.

- The CEO console is separate from every gym's member-management workspace.
- Only a platform-owner account authorized by the server can open privileged controls.
- Screenshots redact metrics and use placeholders; never copy passwords, assigned codes, or customer details into a guide.

READ BEFORE YOU START
Do not use a live customer workspace for QA or tutorial screenshots. Take a fresh backup before any restore or migration operation.

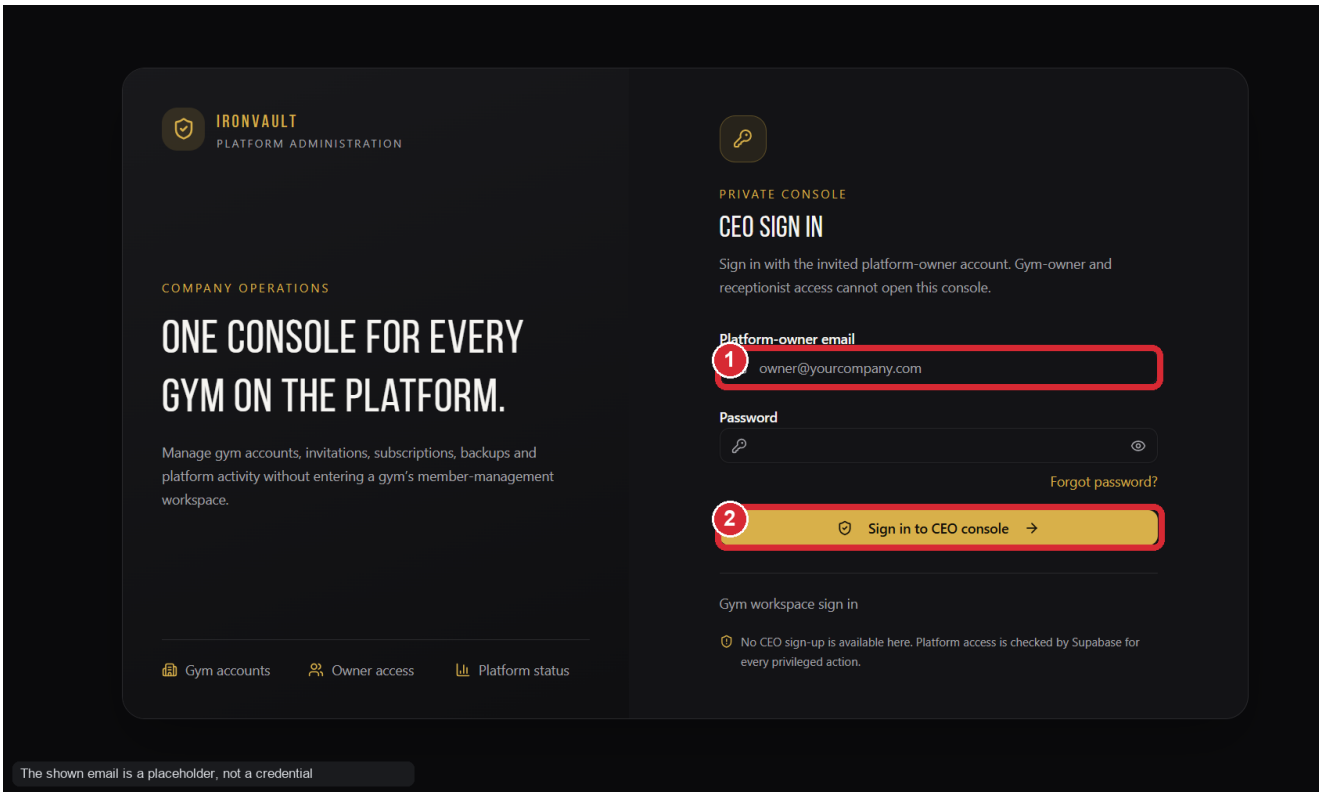

Quick route map

Dashboard - Members - Memberships - Payments - Products - Expenses - Reports - Inquiries - Notifications - Trash - Settings

Visual examples are redacted and use illustrative workspace data. Totals, names, dates, and labels can differ in your gym.

1 - Sign in to the private CEO console

Open the same app host and add /ceo. CEO sign-in is distinct from Gym owner or Receptionist sign-in.

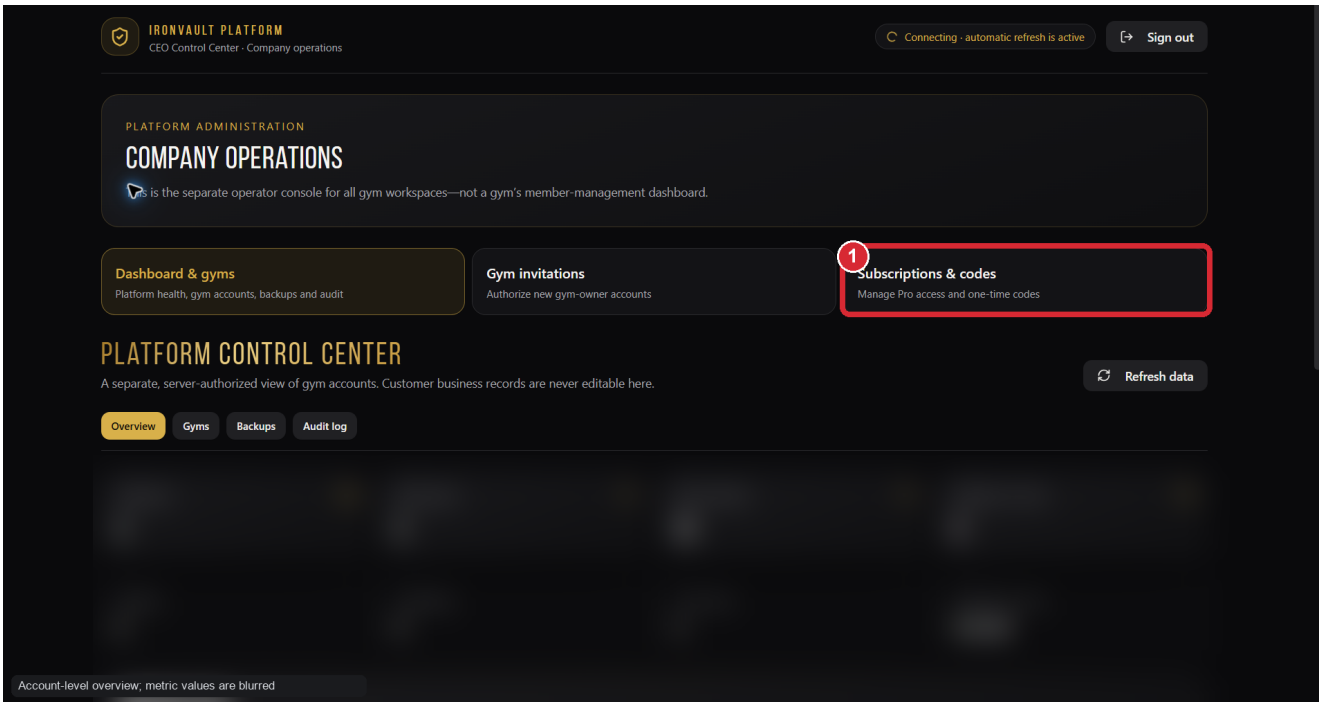

The sample email is a placeholder, not a credential. Red callouts show the email field and sign-in action.

1. Enter the platform-owner email and password that have server-side platform-admin access.
2. No public CEO sign-up is provided. A gym-owner or receptionist account must not be used as a substitute.
3. Use Forgot password only for account recovery. A reset link does not grant platform-admin rights.
4. After sign-in, use Sign out when finished, especially on a shared computer.

IMPORTANT
Never place a real password, reset link, or access token in documentation or a screenshot.

2 - Dashboard, gym accounts, backups, and audit

Dashboard & gyms is a server-authorized platform view; it is not a gym's member-management screen.

Red callout identifies Subscriptions & codes; account metrics are blurred for privacy.

1. Use Overview to check platform health and high-level account counts; metric values can change as gyms update.
2. Use Gyms to select an account and inspect its platform-level status and workspace information.
3. Use Backups to create a workspace snapshot, download it securely, or restore it. A restore first saves a pre-restore snapshot.
4. Use Audit log to review privileged platform activity and its administrator/time context.
5. The live status refreshes automatically; use Refresh data when you need an immediate recheck.

IMPORTANT
Backups contain private gym business data. Store downloaded files in an access-controlled location; verify the selected gym before restoring.

3 - Gym invitations

Invitations authorize a new gym-owner account under the platform's existing server-side sign-up controls.

1. Open Gym invitations, add the exact owner email, and verify it carefully before saving.
2. Share the sign-up instructions with that owner through a private channel.
3. Review pending, used, or revoked invitation status in the console. A revoked invitation blocks future signup, not an already existing session.

IMPORTANT
An invitation is not an account-disable control. Do not promise that revoking an invite signs out an existing user.

4 - Subscriptions and assigned codes

This area manages platform-level owner Pro access and one-time codes. Owner Pro and an individual gym member's membership are separate.

Red callouts show recipient/duration fields and Generate assigned code. Example values are anonymized.

1. Select the correct authorized gym-owner account before generating a code.
2. Choose the agreed access duration and redemption window, then review the confirmation before generating.
3. Copy the one-time code immediately and share it privately with that owner. The code is account-bound and can be redeemed once.
4. Manual or recharge Pro access can be adjusted or revoked in the console. Paid provider subscriptions are managed by the payment provider and are not shortened here.

IMPORTANT
A Pro grant changes workspace capacity/access. It does not create a member membership or change that member's plan.

5 - Member Migration Center

The migration tool prepares records in one designated demo/source gym and transfers a reviewed selection into an active destination gym.

1. Confirm the designated source and destination names. The destination must be active, have a workspace, and satisfy its current membership capacity.
2. Upload CSV or the first worksheet of an .xlsx file (up to 8 MB / 5,000 records), or enter a member manually. Map columns to the existing member fields.
3. Review validation errors, missing required fields, and possible duplicates. Correct, remove, or explicitly resolve rows before import.
4. For transfer, select members and inspect the source/destination, count, and duplicate warnings. Confirm by re-entering the destination gym name.
5. The transfer copies member profiles and membership terms, retaining term dates, status, and price snapshots; existing plans are matched/copied automatically. Linked payment transfer is an explicit option.
6. Review the actual operation result and Migration history. If a request fails, check history before retrying; do not assume a timeout means nothing committed.

IMPORTANT
Source profiles are kept in source Trash for recovery. Do not move unrelated sales, invoices, or private photos unless the operation explicitly includes them. Use staging data for QA.

6 - Safety checklist and recovery

Use this short checklist before any account-level change that can affect access or business data.

1. Verify the selected owner email, gym name, source/destination, and exact duration or member count.
2. Create a fresh backup before restoring a workspace. Keep the backup in a protected location.
3. For member migration, inspect the preview and plan/payment options, confirm the destination name, and wait for confirmed results.
4. After the operation, refresh the destination gym and verify representative member profiles, membership dates, and the operation history.
5. If an owner loses access, use the supported subscription or auth recovery control; do not edit customer records to work around a platform issue.

IMPORTANT
This guide is based on current repository behavior and the safe screenshots available at creation time. Protected migration, invitation, backup, and audit screens still require staging credentials for a full screenshot/interaction verification pass.
